

Optiminastic | CarbonCut — Marketing CO₂e Calculation Framework

This document provides the official methodology used by Optiminastic | CarbonCut to calculate carbon emissions (CO₂e) generated through marketing activities. The framework follows the GHG Protocol, ensuring global credibility and alignment with Scope 1, 2, and 3 reporting requirements.

Master Equation

The general equation to calculate marketing-related CO₂e is:

$$\text{CO}_2\text{e}_{\text{marketing}} = \sum_c \sum_i (Q_{c,i} \times \text{EF}_{c,i}) + \sum_a (A_a \times \text{EF}_a)$$

Where:

- $Q_{c,i}$ = activity data for channel c , item i (kWh, km, kg, GB, hours, impressions, etc.)
- $\text{EF}_{c,i}$ = emission factor (kg CO₂e per unit)
- A_a = allocated overheads/embodyed components (e.g., office energy allocation)
- EF_a = matching emission factor for overheads

Important: Always report offsets separately. Do not net them into gross emissions.

Channel Plug-in Equations

1) Ad production (film/photo/audio shoots)

$$\text{CO}_2\text{e}_{\text{prod}} = (\text{Travel}_{\text{km}} \times \text{EF}_{\text{mode}}) + (\text{Power}_{\text{kWh}} \times \text{EF}_{\text{grid}}) + \sum (\text{Materials}_{\text{kg}} \times \text{EF}_{\text{mat}}) + (\text{Cloud}_{\text{GB-months}} \times \text{EF}_{\text{cloud}})$$

2) Digital / Programmatic Media

$$\text{CO}_2\text{e}_{\text{digital}} = I \times ((\text{E}_{\text{ad-tech}} + \text{E}_{\text{ad-server}} + \text{E}_{\text{CDN}}) / I + (\text{Data}_{\text{GB}} / I \times \text{EI}_{\text{network}})) \times \text{EF}_{\text{grid}} + (I \times t_{\text{view}} \times P_{\text{device}} \times \text{EF}_{\text{grid}})_{\text{optional}}$$

3) Search & Social Ads (paid)

$$\text{CO}_2\text{e}_{\text{paid}} = U \times ((\text{E}_{\text{platform}} + \text{E}_{\text{ad-delivery}}) / U + (\text{Data}_{\text{GB}} / U \times \text{EI}_{\text{network}})) \times \text{EF}_{\text{grid}}$$

4) Owned Social Posts (organic)

$$\text{CO}_2\text{e}_{\text{owned}} = N_{\text{posts}} \times (\text{E}_{\text{creation}} + \text{E}_{\text{upload}}) \times \text{EF}_{\text{grid}} + (\text{Views} \times t_{\text{view}} \times P_{\text{device}} \times \text{EF}_{\text{grid}})_{\text{optional}}$$

5) Email Marketing

$$\text{CO}_2\text{e}_{\text{email}} = S \times ((\text{Data}_{\text{GB}} / S \times \text{EI}_{\text{network}}) + (\text{E}_{\text{ESP}} / S)) \times \text{EF}_{\text{grid}} + (\text{Opens} \times t_{\text{read}} \times P_{\text{device}} \times \text{EF}_{\text{grid}})_{\text{optional}}$$

6) Website / Landing Pages

$$\text{CO}_2\text{e}_{\text{web}} = \text{Visits} \times ((\text{Bytes}/\text{Visit} \times \text{EI}_{\text{network}}) + (\text{E}_{\text{origin/CDN}} / \text{Visit})) \times \text{EF}_{\text{grid}} + \text{Hosting}_{\text{kWh}} \times \text{EF}_{\text{grid}}$$

7) Print (flyers, magazines, inserts)

$CO_2e_{print} = \Sigma(Paper_mass_kg \times EF_paper) + (E_printing_kWh \times EF_grid) + (Freight_ton-km \times EF_mode)$

8) Out-of-Home (OOH)

Static OOH: $CO_2e_{static} = (Materials_kg \times EF) + (Install_trips_km \times EF_vehicle) + (Disposal_kg \times EF_waste)$

Digital OOH: $CO_2e_{DOOH} = (P_screen \times hours) \times EF_grid + (Data_GB \times EI_network \times EF_grid)$

9) Events / Experiential

$CO_2e_{events} = (Venue_kWh \times EF_grid) + (Booth_materials_kg \times EF_mat) + (Attendee_travel_pkm \times EF_mode) + (Freight_ton-km \times EF_mode) + (Catering_portions \times EF_menu)$

10) Influencer & Creator Marketing

$CO_2e_{creator} = Production_footprint + Travel + Cloud/Editing + Content_delivery$ (use \$2–5 formulas)

11) PR & Press

$CO_2e_{PR} = Print + Parcel_freight + Events + Travel$ contributions

12) Giveaways / Merchandise

$CO_2e_{swag} = \Sigma(Item_mass_kg \times EF_material) + (Freight_ton-km \times EF_mode) + (Packaging_kg \times EF)$

13) Martech & Cloud Services

$CO_2e_{martech} = (Cloud_kWh \times EF_grid(region))$

14) Team Travel

$CO_2e_{travel} = \Sigma(Distance_km \times EF_mode/class)$

15) Office Energy Allocation

$CO_2e_{office \rightarrow mktg} = (Office_kWh \times EF_grid) \times Allocation_share$
